- gsg_2022-02-23_2022-02-26_20_perc.parquet.br Ukrainian War
- gsg_2024-04-13_2024-04-16_20_perc.parquet.br Iran- Israel
- gsg_2024-04-30_2024-05-03_20_perc.parquet.br Palestinian protest

Trending news, GDELT data, motivation intruduction.

- Trending news
- GDELT Data
 - (Global Database of Event Language and Tone)
 - 15 min update intervall
 - Vector embedding per article (512 dim)
 - Data mining

Intresse över tid ?

Covid: UK(blue), USA(red)

Assumptions

- General base

The news articles with similar topics will be clustered together by the USE embedding vector, and the denser (more articles in it) the cluster the trending the topic (of those articles) is at a certain timestamp.

- Topic

For each group of articles (cluster) there exist a topic that describes it perfectly

- Dimensionality reduction

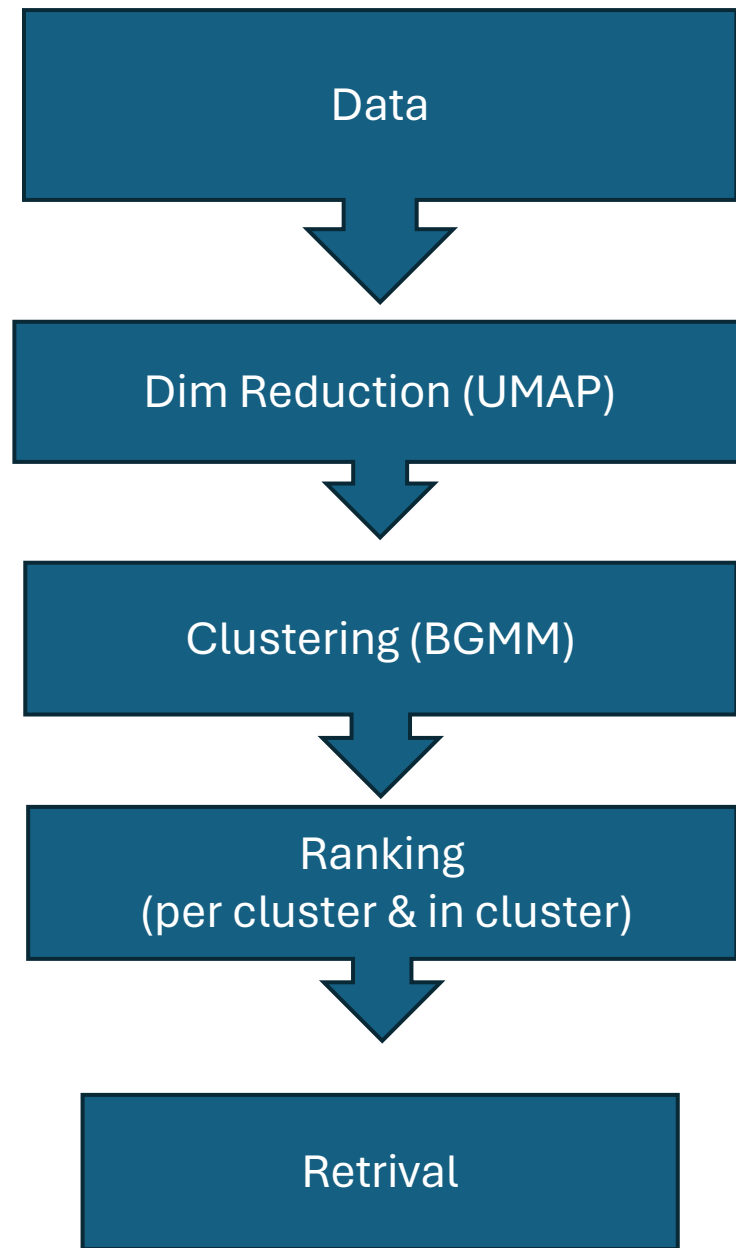

All articles within the same topic will be pushed together close enough to be clustered into a single cluster

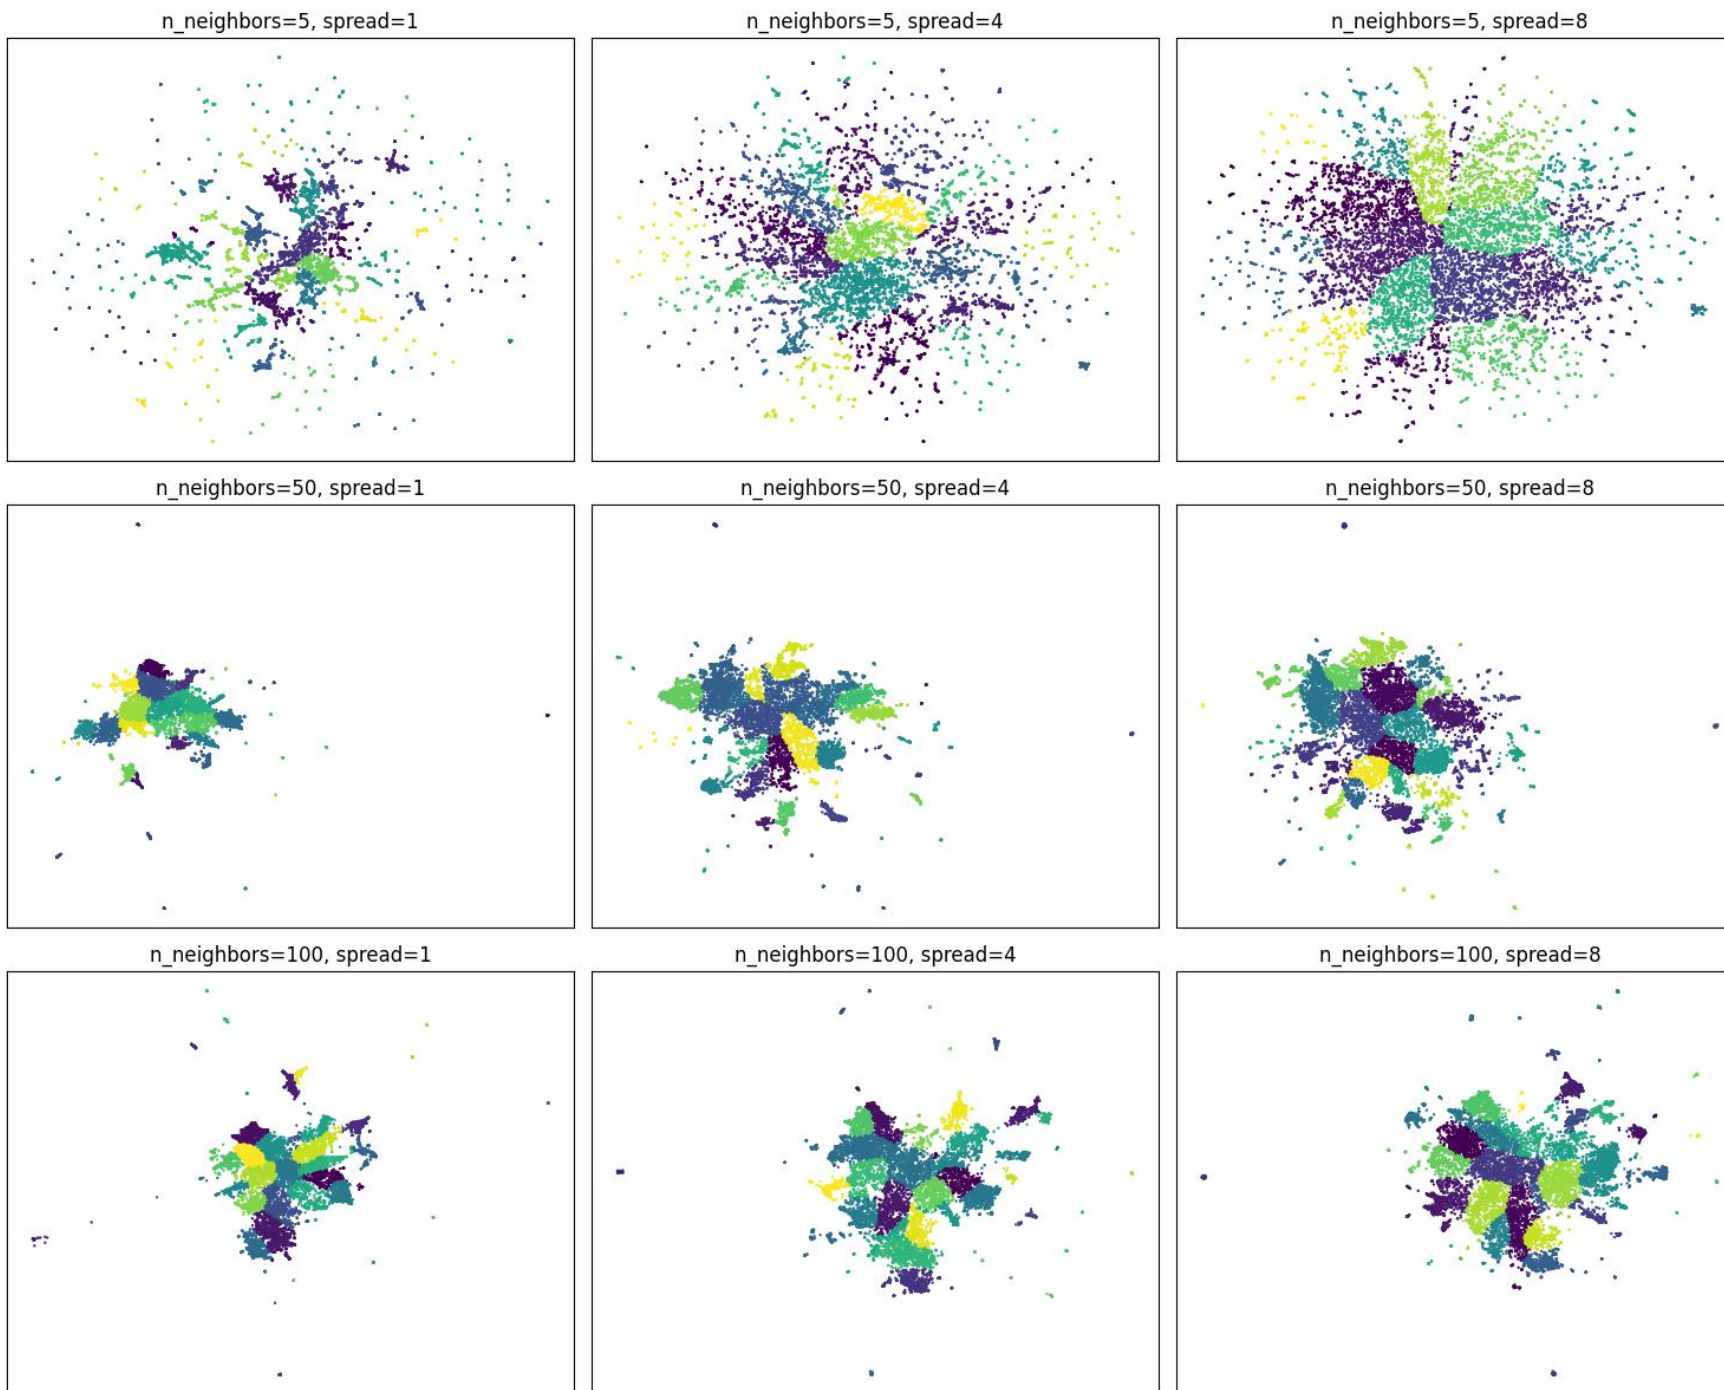

All articles with different topics will be separated far enough, to build multiple clusters

- Clustering

The clustering algorithm will perfectly cluster all articles within the same topic

Pipeline

Tuning Parameters

- $n_neighbors$
Local and global structure
- Spread
Clustering of datapoints
- Trade-off
50–100, 4
